

ANTIMUSGO-LUQSA

5 kg
25 kg

COMPOSITION

30% water-soluble iron (Fe) by weight.

USES

ANTIMUSGO-LUQSA is an iron sulphate-based fertilizer formulation that is characterised by providing cultivated soils with iron, and to control algae, mosses and lichens that appear on lawns.

We recommend applying ANTIMUSGO-LUQSA twice a year (spring and autumn). On lawns, it acts as a deficiency corrector and revives the lawn. It removes the mosses, algae and lichens that can appear and also acts as prevention against cryptogamic diseases. Moss spores take between 8 to 12 weeks to dry, so you should wait this time before resowing the lawn.

DOSES AND HOW TO USE

Apply ANTIMUSGO-LUQSA on the surface to be treated, at a rate of 5-15 g/m² per application.

Use gloves.

Water after each application.

USAGE PRECAUTIONS

The product is irritant, so we recommend avoiding direct contact with it and the use of gloves.

Store the product in its original container and in a dry place.

Never pull up live moss with a rake, as the spores will spread to other parts of the lawn.

For more information, please consult our Agronomy Technical Department.
